Summit County Local Health District Report

Inside
Introduction

Cardiovascular disease is the leading cause of death in the United States and Utah. Cardiovascular disease includes those diseases that affect the heart and blood vessels including coronary heart disease, stroke, congestive heart failure, and hypertension. Several modifiable risk factors contribute to cardiovascular disease including high blood pressure, high blood cholesterol, tobacco use, excessive alcohol consumption, inadequate physical activity, poor nutrition, obesity, and diabetes.

This report examines the burden of cardiovascular disease in Utah and each of Utah's 12 local health districts. The data presented on cardiovascular disease come from several sources including the Utah Behavioral Risk Factor Surveillance System, Utah Death Certificates, and the Utah Hospital Discharge Database.

The data have been divided by geographic area to provide a general overview of health status in each local health district. Local programs will find this information useful when presenting a case for heart disease and stroke prevention in their areas. The information is also useful for program planning, setting priorities, and evaluation.

Prevention Program

Table 1.

Demographics, Utah vs Summit County Health District

Demographic Subgroup	Health District Population — Number of Persons	Distribution	95% Confidence Intervals — Lower	Upper	State Population — Number of Persons	Distribution
Gender						
Males	19,603	52.1%			1,303,786	50.5%
Females	18,021	47.9%			1,278,585	49.5%
Total	37,624	100.0%			2,582,371	100.0%
Age Group						
0 to 4	2,875	7.6%			254,065	9.8%
5 to 17	7,207	19.2%			550,504	21.3%
18 to 49	18,352	48.8%			1,221,336	47.3%
50 or Over	9,190	24.4%			556,466	21.5%
Total	37,624	100.0%			2,582,371	100.0%
Race/Ethnicity						
White	32,952	97.4%			2,241,072	93.8%
Black	150	0.4%			22,534	0.9%
American Indian/Alaskan Native	143	0.4%			32,191	1.3%
Asian	386	1.1%			44,608	1.9%
Pacific Islander	3	0.0%			17,368	0.7%
Other	209	0.6%			31,266	1.3%
Total	33,843	100.0%			2,389,039	100.0%
Non-Hispanic	30,373	89.7%			2,135,966	89.4%
Hispanic	3,470	10.3%			253,073	10.6%
Unemployment	1,047	6.2%			56,610	4.7%
Income						
Less Than $20,000	4,500	12.0%	8.9%	15.9%	390,900	15.1%
$20,000-$49,999	11,500	30.6%	26.5%	35.0%	1,054,600	40.8%
$50,000 and Over	21,600	57.4%	53.2%	61.6%	1,136,800	44.0%
Education						
Less Than High School	2,900	7.6%	5.0%	11.4%	183,800	7.1%
H.S. Grad or G.E.D.	9,700	25.7%	22.0%	29.8%	717,500	27.8%
Some Post High School	8,300	22.2%	18.9%	25.8%	870,300	33.7%
College Graduate	16,800	44.5%	40.9%	48.3%	810,700	31.4%
Do Not Have Health Care Coverage	6,000	16.0%	12.8%	19.9%	364,900	14.1%
Unable to Get Health Care Due to Cost	3,700	9.8%	7.2%	13.2%	320,200	12.4%
Report Having "Fair" or "Poor" Health	4,200	11.1%	8.2%	15.0%	347,300	13.5%
Seven or More Days of Poor Mental Health	4,200	11.2%	8.6%	14.5%	392,800	15.2%

Risk Factors

Physical Activity
Regular physical activity reduces the risk of cardiovascular disease in general and of coronary heart disease in particular. Adults should get at least 30 minutes of moderate intensity exercise five or more days a week, or at least 20 minutes of vigorous exercise three or more days a week.[1]

Fruits and Vegetables
A diet of five or more servings of fruits and vegetables per day is associated with a reduced risk of coronary heart disease, some types of cancer, diabetes, and other chronic diseases.[2] Fruits and vegetables are low in fat and high in vitamins, minerals and fiber. A healthy diet that includes fruits and vegetables can reduce blood pressure and blood cholesterol levels. In general, a person should eat at least two servings of fruit and three servings of vegetables a day.

Obesity
Obesity is fast approaching smoking as the leading preventable cause of death in the United States. An estimated 300,000 deaths a year can be attributed to obesity. Adults who are overweight or obese are at increased risk of hypertension, high blood cholesterol, type 2 diabetes, coronary heart disease, stroke, and certain forms of cancer.[3,9]

Smoking
Smoking is the leading preventable cause of death in the United States. Cigarette smoking causes heart disease, chronic lung disease, several kinds of cancer, and other diseases.[4]

Diabetes
Diabetes is a disease in which blood glucose levels are above normal. Diabetes can cause serious health complications including heart disease, blindness, kidney failure, and lower-extremity amputations. Diabetes is the sixth leading cause of death in the United States and Utah.

* Includes 2001 data
** Among adults who smoke

High Blood Pressure

High blood pressure is a leading cause for cardiovascular disease. Hypertension, often called high blood pressure, is having a systolic blood pressure of 140mm Hg and higher or a diastolic blood pressure of 90mm Hg and higher. A person with high blood pressure should be diagnosed by a doctor before concluding that that person has hypertension. Hypertension is related to an increased incidence of heart disease, heart attack, stroke, atherosclerosis, and coronary artery disease. Individuals with high blood pressure should take steps to reduce and control their blood pressure.[7]

High Blood Cholesterol

High levels of cholesterol and triglycerides increase the risk for heart disease. The National Heart, Lung, and Blood institute defines high blood cholesterol as 240 mg/dl or greater and "borderline high" cholesterol as 200 to 239 mg/dl. Cholesterol and other fats can't dissolve in the blood. They have to be transported to and from the cells by special carriers called lipoproteins. There are two types of lipoproteins that are important in our bodies: low-density lipoprotein (LDL), which carries cholesterol to the arteries, and high-density lipoprotein (HDL), which removes cholesterol from the arteries. High levels of LDL and low levels of HDL are related to an increased incidence of heart disease, including heart attack, atherosclerosis, and coronary artery disease. Individuals with high cholesterol should take steps to reduce and control their cholesterol levels.[8]

* Percentage of all respondents, results should not be interpreted as prevalence of high cholesterol.

Mortality

Cardiovascular disease is the leading cause of death in the United States and in Utah. Cardiovascular disease includes a wide variety of diseases including coronary heart disease, stroke, congestive heart failure, and hypertension. Almost 4,000 Utahans die each year from cardiovascular disease, which accounts for 30% of all deaths in Utah. Heart disease and stroke are also the leading causes of disability in the country.[5]

ICD-10 Codes : See appendix A

Pre-transport

Early access to medical services is critical in determining the outcome of a stroke or heart attack. Only a small percent of patients who could benefit from treatments like clot-dissolving therapy or defibrillation actually receive treatment early enough for them to work.[5] Individuals who do not recognize the signs and symptoms of a heart attack or stroke are less likely to receive the treatment they need before it's too late. The best strategy is to be aware of the early warning signs and respond to them by calling 911 immediately.

Figure 5.

Pre-transport Death and Knowledge of Signs and Symptoms of Stroke. Utah vs Summit CountyHealth District

Legend: ■ Summit ■ Utah

- Pre-transport Stroke Deaths*: Summit 40.8%, Utah 36.1%
- Know Major Symptoms of Stoke**: Summit 45.5%, Utah 44.8%
- Know Major Symptoms of Stoke** and Would Call 911 in Case of a Stroke: Summit 37.6%, Utah 37.9%
Sources: * Utah Death Certificate Database, Office of Vital Records, Utah Department of Health 1999-2004, Age-adjusted to 2000 population; defined as the percentage of stroke deaths that occur before transport to an emergency department
** BRFSS, Office of Public Health Assessment, Utah Department of Health 2001-2005, Age-adjusted to 2000 population; defined as the percentage of adults 18 and over who could identify all 5 of the major symptoms of stroke

** BRFSS, Office of Public Health Assessment, Utah Department of Health 2001-2005, Age-adjusted to 2000 population; defined as the percentage of adults 18 and over who could identify all 5 of the major symptoms of heart attack

Hospitalization

In 2004 the United States spent over $225 billion on cardiovascular disease. Almost half of those costs were spent on hospitalization.[6]

Table 2.

Average and Total Hospitilization Costs for Primary Diagnosis, Utah vs Summit County Health District

Condition	Summit County Health District			Utah		
	Average Hospitilization Cost per Diagnosis	Average Total Annual Cost	Percent of Cost Paid by Government	Average Hospitilization Cost per Diagnosis	Average Total Annual Cost	Percent of Cost Paid by Government
All Cardiovascular Disease	$26,120.58	$4,196,706.00	51.4%	$22,545.81	$445,738,091.00	67.6%
Coronary Heart Disease	$31,143.95	$1,930,924.67	48.0%	$28,346.39	$212,777,462.67	63.4%
Acute Myocardial Infarction	$29,157.26	$738,650.67	36.3%	$30,802.51	$84,214,063.33	61.4%
Congestive Heart Failure	$15,916.88	$270,587.00	59.3%	$15,843.41	$46,616,597.33	79.7%
Stroke	$19,976.46	$439,482.33	37.6%	$15,214.63	$49,442,462.00	69.5%

Appendix A

The International Classification of Diseases, Ninth and Tenth Revisions, Clinical Modification (ICD-9-CM and ICD-10 CM) were used to identify the specific disease categories in this report. The following ICD-9 or ICD-10 codes have been grouped together to determine rates for the specific conditions included in this report.

ICD-9 and ICD-10 Codes by Cause			
Condition/Procedure	Type of Data	ICD-9 Codes	ICD-10 Codes
All Cardiovascular Disease	Mortality	390-448	I00-I78, G45
	Hospital Discharge	390-448	
Coronary Heart Disease	Mortality	402, 410-414, 429.2	I11, I20-I25
	Hospital Discharge	402, 410-414, 429.2	
Acute Myocardial Infarction	Mortality	410	I21-I22
	Hospital Discharge	410	
Congestive Heart Failure*	Mortality	428.0, 428.1, 428.9	I50.0, I50.1, I50.9
	Hospital Discharge	428.0, 428.1, 428.9, 398.91**	
Stroke	Mortality	430-438	I60-I69
	Hospital Discharge	430-438	

* According to guidelines governing the writing of cause-of-death statements, congestive heart failure should not be listed as an underlying cause of death and, therefore, these data should be interpreted with caution.
** Mortality data were not coded to the fifth digit and, therefore, ICD-9 code 398.91 was not included in the definition of congestive heart failure when analyzing mortality data.
